Hydrocracking and Hydrotreating Processes and Catalysts for Upgrading Renewable Oils, Residual Oils, Lube Base Stocks, and Olefin Plant Feedstocks

Nominal Cosponsors: CATL, ENVR

Hydrocracking and hydrotreating (together known as hydroprocessing) are the heart of modern refining. They are used for upgrading renewable oil, petroleum residue, lubricant base stocks, and feeds to petrochemical plants. Most new refinery investments include hydroprocessing. Areas of special interest include catalyst development, process development, feedstock characterization, reaction mechanisms, real-time optimization, and safety.

Organizers

Paul Robinson  
Haldor Topsoe  
pr.robinson@yahoo.com

César Ovalles  
Chevron Technical Center
